3. With keeper in closed position, install new double switch (Figure 3).

   Hold keeper in closed position while installing switch and after switch is installed or switch actuator can be damaged.

   [Image: Figure 3]

4. Snap new strain relief around DS wires (Figure 4-1) and slide into box slot with flat part facing out as shown (Figure 4-2).

   [Image: Figure 4-1 and Figure 4-2]

5. Place keeper spring as far left as possible and verify that spring's hook is seated in keeper's spring slot (Figure 5).

   [Image: Figure 5]

6. Secure box top on box and while ensuring that the keeper spring does not move out of position, and that the wire strain relief is secure (Figure 6).

   [Image: Figure 6]

7. Reattach the box to the faceplate and reinstall strike. See Figure 1.

NOTES:

If the current being sent through the switch is less than 100mA a Gold contact switch (100mA) must be used.

If the current is greater than 100mA use the standard switch (standard switches are rated for a maximum of 2A).

Type B switches are required for 6211WF and 6212WF units.

A non DS unit can not be upgraded to a DS unit with this kit because the kit does not contain a tripper.
