**70 SERIES MAGNETIC LOCK**

**INSTALLATION INSTRUCTIONS & CUT-OUT TEMPLATE**

The 70 Series magnet is powered by 12 or 24VDC only. Schlage offers several power supplies which can be used to power magnetic locks. Magnetic locks are usually controlled by an access control reader (card, prox, etc.) and an egress device such as an exit device with a switch, pushbutton and/or motion detector. In most cases it is required that activation of building’s fire alarm system cause all magnetic locks to unlock. Consult local authority having jurisdiction regarding system requirements for local life safety and electrical codes.

1) Place template on door and frame as shown. Leave room if required for existing door hardware such as vertical rod panic hardware, etc. Drill required holes.

2) Install armature plate assembly. Note that armature plate assembly must pivot about the mounting bolt. This is to allow the magnet and armature to mate when the door is closed. If the armature does not pivot, check to see that there is no binding in the 1/2” armature guide holes and that the hardware is installed correctly.

3) Refer to wiring chart and make wiring connections.

4) Install magnet.

NOTE: Magnet and armature must mate when door is in closed (and latched if applicable) position. Adjust by adding/subtracting shim washers.

**STANDARD SINGLE DOOR**

Magnet is typically located near latch side of door for maximum locking power. If required, lock can be mounted vertically. Consult local authority having jurisdiction to ensure compliance with local life safety and electrical codes.
